

## **INTERPHASE INTRODUCES SUPER-FAST CHART MASTER V6 AND V6i GPS COLOR CHART PLOTTERS**

### **Combines Amazing Speed, Brilliant Sunlight Readable Color Screen & Advanced Features**

Interphase Technologies is known for marine electronics that offer state-of-the-art technology, compact size and user-friendly features, all priced within the range of most boaters. Carrying on this tradition for 2004 is Interphase's new Chart Master™ V6 Series – high performance color GPS/chart plotters that offers forward-thinking engineering and features normally associated with high-priced, large commercial grade machines. The Chart Master V6i is completely self-contained with an internal GPS antenna, and the V6 comes with an external active antenna.

One of the first things a boater will notice about the Chart Master V6 series is their vertically oriented high-definition (320x240 pixel) six-inch super-bright color LCD displays. They provide clear visibility even in full sunlight, and the Chart Master V6i, with its built-in GPS antenna is a great choice for boats with open cockpits, center consoles and flying bridges and can serve well as a back-up unit on larger vessels. Another first is the rugged waterproof silicon rubber front casing that includes a secure slot for the C-Map NT+ cartography and is covered with an easy snap-off bezel.

It's the state-of-the-art engineering inside, however, where the Chart Master V6 series really shines. Both the models combine a new detailed base map of the world, a 200 Mhz super-fast RISC based processor for lightening fast zooms and pans with the outstanding accuracy of 12-channel satellite differential (WAAS) reception. And both sport an easy-to-use, joy-stick pointing device to control the on-screen cursor and select among the many advanced features.

The Chart Master V6 series uses the latest C-Map NT+ cartography with access to all the latest features such as Guardian Technology™ –a forward looking depth alarm feature that warns the boater about dangerous shoals, obstacles or hazards ahead on the current course. This feature, in particular, can provide the boater with useful information and improve safety – especially when used in combination with Interphase Technologies' forward-scanning sonar products.

Both the V6 and V6i are also ready for connection to the new Interphase Black Box Fishfinder Systems that provide single or dual frequency fishfinding capabilities in both full and split screen modes on the bright color displays. They will also work with the award-winning C-Forecast™ system for wind and wave forecast overlays right on the chart plotter. It also offers increased storage capacity of up to 500 waypoints and 50 routes, and gives boaters the ability to transfer waypoints and routes to a PC by using C-Map user cards. This is important to bluewater anglers, sailors and cruisers who like to plan their voyages at home. Suggested retail price for the Chart Master V6i is \$959 and \$1079 for the new V6.
